apical membrane antigen-1 (AMR-1) of the assual blood stage of plasmodium falciparum. It is used in the construction of recombinant protein Coc/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His)6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes (SSP-2). Hiver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete of the life cycle of P. falciparum. CDC/MIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/MIIMALVAC-1 vaccine has malarial infections. Anti-CDC/MIIMALVAC-1 unibodies can be used for hard-ning in it, in it, in it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present sequence is that of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His)6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-156 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of Plasmodium falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treamment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. falciparum in biological samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                         RMA-1 can generate an immune response to malaria, and antibodies which can inhibit growth of the parasite. RMA-1 initially has mol. wt. 80 kD.

AAQ80910 encodes AAR68840 the P. falciparum AMA-1 gene product. New recombinant poxviruses containing either the SERA, ABRA, Pfhsp70, AMA-1, Pfs25, Fish, CSP, PfSSP2, LSA-1, LSA-1 repeatless, MSA-1, MSA-1 (N-terminal p83 or C-terminal p942) genes, or a combination of these in non-essential regions of their genomes are claimed. These poxviruses (pref. with a virulence reducing genomic deletion or disruption) can be used as vaccines against malaria and for the produ. Of Plasmodium immunogens. These viruses provide multicomponent, multistage vaccines due to their expression of sporozite, liver stage, blood stage and sexual stage proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Plasmodium vivax 66kD merozoite antigen protein partial sequence.

                                                                                                                                                                                                                       This protein is encoded by a recombinant DNA molecule comprising the complete P.vivax merozoite antigen gene and e.g. a pUC19 to vaccinia virus vector sequence and regulatory elements. This allows efficient expression of the antigen on transformation of host cells. It is useful in an anti-malarial vaccine for ferring immunity against the merozoite form of the parasite and preventing infection of uninfected red blood cells.
                                                                                                                                                                         Plasmodium merozoite antigen proteins and DNA sequences - useful in vaccine prodn., anti-malarial drug design, and in diagnostics

The invention relates to peptide sequences present in the synovial fluid and membranes of rheumatoid arthritis patients, arising from the CDR region of oligoclonal pathogenic T-cell antigen receptor Vbeta chains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Compositions which contain autoantigenic peptides binding specifically to T-cells expressing receptors containing the peptide sequences, which include antigen specific immunological tolerance to rheumatoid arthritis can be used for the treatment and prevention of rheumatoid arthritis. The invention can be used for the diagnosis, treatment and prevention of rheumatoid arthritis. Sequences AAX66771-958 represent peptides from the various vbeta chains of T cell antigen receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       T-cell antigen receptor V-beta chain CDR3 region sequences accumulated in synovial membranes of rheumatoid arthritis patients
                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Rheumatoid arthritis; arthrosis deformans; T-cell antigen receptor; Vbeta chain; autoantigen; immunological tolerance.
                                                                                       This protein is encoded by a recombinant DNA molecule comprising the complete P.knowlesi merozoite antigen gene and e.g. a pUC19 or vaccinia virus vector sequence and regulatory elements. This allows efficient expression of the antigen on transformation of host cells. It is useful in an anti-malarial vaccine for conferring immunity against the merozoite form of the parasite and preventing infection of uninfected red blood cells.
Plasmodium merozoite antigen proteins and DNA sequences – useful in vaccine prodn., anti-malarial drug design, and in diagnostics
                                                                                                                                                                                                                                                                                                                                                               ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to the isolation of novel G-protein coupled receptor (GPCR) genes and their encoded proteins. This sequence represents the protein sequence of a human GPCR. The DNAs and proteins are used for the treatment, prevention and diagnosis of disorders of the nervous system. The proteins and its fragments are also promoters

The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (1) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

(I) and (II) are useful for the development of vaccines against P. falciparum infection. (I) and polyvolonal antisera or a monoclonal artibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in subsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the subsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasite lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many drugs. AAA70078 to AAA70287 and AAB18352 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the specification.
                                                                                                                                                                                                                                                                                                                                                               Proteins encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum, useful as antimalarial vaccines and in the diagnosis of P.falciparum infection
                                                                                                                                                                                                                                                                                        Venter JC;

AAG82140 standard; Protein; 134 AA. (first entry) 03-SEP-2001 AAG82140;

S. epidermidis open reading frame protein sequence SEQ ID NO:1374. Staphylococcus epidermidis SR1 strain; infection; diagnosis; vaccination; endocarditis.

Staphylococcus epidermidis

AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides CC (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. CI) and (II) can have antibacterial activity and therefore can be used to reaction in the nucleic acids (I) may be used to produce the containing them which are used to produce hosts cells which express the containing them which are used to produce hosts cells which express the containing them which are used to produce sacis) may then be containing them which are used to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their cativity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53091 to AAH55090 represent specifically claimed S. epidermidis genomic DNA polyputcleotide sequences from the present invention. AAH55091 to AAH55098 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention. AAH55091 to sequence listing of the present specifically claims all the polynucleotide sequence listing of the present specification, however the sequence listing of the present specification, however the sequence listing of the present correction, however the sequence listing of the present specification, however the sequence are given in the disclosure for SEO ID NO:4454 so even to sequences are present for SEO ID NO:4455 to 4472, Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis -Claim 18; Page 389; 2188pp; English. 09-NOV-2000; 2000WO-US30782. 99US-0164258 (GLAX) GLAXO GROUP LTD.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               designated SDR2. SDR2 polypeptides and polynucleotides are useful for diagnosing susceptibility to diseases by detecting mutations in the SDR2 gene, and can diseases associated with SDR2 protein imbalance by determining SDR2 polypeptide expression levels. SDR2 polypeptides can be used to screen for agonists and antaqonists and to produce antibodies. Diseases diagnosed, prevented and treated include: cancer, inflammation, autoimmunity, allergy, asthma, rheumatoid arthritis, CNS inflammation, autoimmunity, allergy, asthma, rheumatoid arthritis, CNS inflammation, multiple sclenosis, amylotrophic lateral sclenosis, head injury damage, and other neurological abnormalities, septic shock, sepsis, stroke, cardiovascular disease, kidney disease, liver disease, ischaemic injury, cardiovascular disease, kidney disease, liver disease, ischaemic injury, myocardial infarction, hypotension, hypertension, AllSS, myelodysplastic syndromes and other hematological abnormalities, apastic anaemia, male

and protein sequences isolated from eucalyptus (Eucalyptus grandis) or pine (Pinus radiata also known as Monteery pine). The protein sequences are involved in cell signaling. The polynucleotide and protein sequences are involved in cell signaling. The polynucleotide and protein sequences can be used to modify the response of plant cells to external signals e.g. environmental changes or pathogens during the growth and development of a plant. They can be used to modify cell proliferation, differentiation, elongation and survival, resistance to disease and nutrient metabolism. Examples of modifications which can be produced are altered fruit ripening and senescence of leaves and flowers or enhance altered fruit ripening and senescence of leaves and flowers or enhance conficuations can be used to delay senescence in selected cell types or organs providing fruit and vegetables which have a longer shelf life organs providing fruit and vegetables which have a longer shelf life constitutes plants. Other wood which can be used in solid timber furniture and veneers.
                                                                                                                                                                                                                                                                                                                                                                                                                  Isolated polynucleotide encoding a polypeptide involved in cell signaling used for generating transgenic plants with modified responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Respiratory disease; pneumonia; bronchitis; heart disease; sarcoldosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Intra-generic conservation and limited inter-strain variation in a protective minor surface antigen of Plasmodium knowlesi merozoites.";

Mol. Blochem. Parasitol. 44:141-144(1991).

-I- Blochem. Parasitol. 44:141-144(1991).

-I- FUNCTION: MEROZOITE RECEPTOR PK66 IS A SURFACE ANTIGEN INVOLVED

IN PARASITE INVASION OF ERYTHROCYTES.

-I- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN. CONCENTRATED AT THE APICAL END PRIOR TO RUPTURE, FOLLOWING WHICH IT CAN DISTRIBUTE

ITSELF ENTIRELY ACROSS THE SURFACE OF THE FREE MEROZOITE. DURING INVASION PR66 IS EXCLUDED FROM THE ERYTHROCYTE AT, AND BEHIND, THE INVASION INTERFACE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -i- MISCELLANEOUS: PK66 EXPRESSED IN MATURE SCHIZONTS IS RAPIDLY PROCESSED AS THE SCHIZONT RUPTURES. YIELDING A 42/44 KDA DOUBLET ASSOCIATED WITH THE SURFACE MEROZOITE.
